به نام خدا

در این پروژه یک دیتاست که هر رکورد آن یک event است داریم. قرار است با استفاده از یک برنامهی اسپارک دادهها را بصورت label الفاده از یک برنامهی اسپارک دادهها را بصورت stream دریافت و پردازش کنیم. و باید توسط دو ستون date ناهنجاری event را تشخیص بدهیم و به کمک ستون stream که نشاندهندهی ناهنجار بودن یا نبودن است دقت پردازش خود را سنجیده و داخل ترمینال و csv بنویسیم.

این پروژه مراحل مختلفی دارد که بصورت بخشهای زیر پیش میرویم:

نوشتن داده در تاییک کافکا برای استفاده اسیارک

• برنامهای مینویسیم که دادهها را بصورت batch های ۱۰۰ تایی به تاپیک ارسال کند. کد این بخش بصورت زیر است:

```
import pandas as pd
import time
import json
from confluent kafka import Producer
df = pd.read csv('timeseries.csv')
df = df.astype(str)
batch size = 100
kafka bootstrap servers = 'localhost:9092'
kafka topic = 'T4'
producer config = {'bootstrap.servers': kafka bootstrap servers}
producer = Producer(producer config)
total rows = len(df)
# Loop through the dataset and send 100 rows at a time
for i in range(0, total_rows, batch_size):
batch = df.iloc[i:i + batch size]
selected columns = batch[['id', 'date', 'value', 'label']]
json_data = selected_columns.to_json(orient='records')
producer.produce(kafka topic, key=str(batch['id'].iloc[0]),
value=json data.encode('utf-8'))
except Exception as e:
print(f"Error sending batch: {e}")
time.sleep(1)
producer.flush()
```

با دستور زیر تاپیک مورد نظر را میسازیم. و برنامه را اجرا می کنیم:

```
192.168.56.111 - kafka

[root@ambari-server subdir0]# kafka-topics.sh --create --topic T4 --bootstrap-server localhost:9092 --partitions 4 --replication-factor 1
Created topic T4.

[root@ambari-server subdir0]# python3 kafka_producer.py
```

استفاده از اسپارک برای خواندن و پردازش دادهها و تشخیص ناهنجاری

• حالا که کدی زدیم که دادهها را به تاپیک کافکا میفرستد، کدی پیادهسازی میکنیم که با استفاده از اسپارک دادهها را بصورت در است: schema بخواند و هر ۱۰۰ داده که میگیرد را ابتدا طبق schema مورد نظر نمایش میدهیم. کد این بخش بصورت زیر است:

```
from pyspark.sql import SparkSession
from pyspark.sql.functions import col, from json, explode, split, expr
from pyspark.sql.types import StructType, StructField, StringType
# Define your Spark session
spark = SparkSession.builder \
    .appName("SparkConsumeKafka") \
    .config("spark.jars.packages", "org.apache.spark:spark-sql-kafka-0-
10 2.12:3.2.0") \
    .getOrCreate()
df = spark \
    .readStream \
    .format("kafka") \
    .option("kafka.bootstrap.servers", "localhost:9092") \
    .option("subscribe", "T4") \
    .load()
my schema = StructType([
    StructField("id", StringType(), True),
    StructField("date", StringType(), True),
   StructField("value", StringType(), True),
   StructField("label", StringType(), True)
])
# Select the value column as a string
df = df.select(col("value").cast("string"), "timestamp")
# Remove the first and last characters of the string
df = df.withColumn("value", expr("substring(value, 2, length(value) - 2)"))
# Split the 'value' column into separate JSON objects
    explode(split(col("value"), "(?<=\\}), (?=\\{)")).alias("values"),</pre>
"timestamp")
```

```
# Deserialize the JSON data using the defined schema
df = df.select(
    from json(col("values"), my schema).alias("datas"),
    "timestamp",
)
# Extract columns from the 'datas' struct
df = df.select(
    "datas.*",
    "timestamp"
)
def show batch(df, epoch id):
   df.show(100, truncate=False)
# Write to the console with formatted options
query = df.writeStream.foreachBatch(show batch).start()
# Await termination
query.awaitTermination()
# Stop the Spark session
spark.stop()
```

کدمان را با دستور زیر اجرا می کنیم و نتایج بدست آمده در ۱۲۰ جدول ۱۰۰ تایی (چون ۱۲۰۰ داده داریم) نمایش داده میشوند، اما برای سهولت در نمایش ۱۵ ردیف اول را نمایش میدهیم:

```
## 192.168.56.111-spark

[root@ambari-server FinalProject]# spark-submit --packages org.apache.spark:spark-sql-kafka-0-10_2.12:3.2.4 consumer.py

:: loading settings :: url = jar:file:/usr/local/lib/python3.6/site-packages/pyspark/jars/ivy-2.5.1.jar!/org/apache/ivy/core/settings/ivysettings.xml

```

حال میخواهیم به سراغ تشخیص ناهنجاری دادهها برویم. به event هایی ناهنجار می گوییم که مقدار value خیلی متفاوتی با مقادیر قبلی داشته باشد و به اصطلاح داده پرت باشد. به این دادهها outlier datas می گوییم.

تا اینجا به عنوان تلاش اول من سعی به تشخیص ناهنجاری از روی یک دادهی قبل از هر رکورد داشتم.

برای تلاش دوم تشخیص را به کمک میانگین اختلاف دادههای قبلی و درواقع شیب نمودار انجام می دهیم. یک پنجره می سازیم و روی آن حرکت می کنیم. یک ستون برای value قبلی، یکی برای اختلاف دو value پشت هم و یکی برای میانگین اختلاف دادههای قبلی درنظر می گیریم. و در آخر یک ستون به نام detection می زنیم که نشان دهنده ی ناهنجار بودن یا نبودن است. و در انتها datch را داخل یک تاپیک کافکا می ریزیم. که بعدا برای خروجی گرفتن و ساخت csv از آن استفاده کنیم.

```
def show batch(df, epoch id):
    df = df.select(col("id").cast("integer"), "date", col("value").cast("dou-
ble"), "label")
    window spec = Window().orderBy("id") # Last three records
    df = df.withColumn("prev value", lag("value").over(window spec))
    df = df.withColumn("value diff", when(col("prev value").isNotNull(),
abs(col("value") - col("prev value"))).otherwise(lit(0)))
    df = df.withColumn("avg 3 diff", avg(col("value diff")).over(win-
dow spec.rowsBetween(-4, 0))
    threshold multiplier = 2.6
    df = df.withColumn("detection", lit(0))
    df = df.withColumn("detection", when(
        (col("value diff") > threshold multiplier * col("avg 3 diff")) &
        (lag("detection").over(window spec) != 1),
        1).otherwise(0))
    df = df.select("id", "date", "value", "label", "detection")
    df.selectExpr("CAST(id AS STRING) AS key", "to_json(struct(*)) AS value")
      .write \
      .format("kafka") \
      .option("kafka.bootstrap.servers", "localhost:9092") \
      .option("topic", "OT") \
      .save()
```

که نتایجی که بدست می آید مانند زیر است:

کد این بخش بصورت زیر است:

ساخت csv از تاپیک خروجی نوشته شده در کافکا

در آخر توسط فایل kafka_to_csv از تاپیک خروجی تولید شده میخوانیم و توسط writestream آن را در قالب csv مینویسیم. کد این بخش بصورت زیر است:

```
from pyspark.sql import SparkSession
from pyspark.sql.functions import col, expr
from pyspark.sql.types import StructType
spark = SparkSession.builder \
    .appName("TopicToCSV") \
    .config("spark.jars.packages", "org.apache.spark:spark-sql-kafka-0-
10 2.12:3.2.0") \
    .config("spark.sql.streaming.statefulOperator.checkCorrectness.enabled",
"false") \
    .getOrCreate()
spark.sparkContext.setLogLevel("ERROR")
schema = StructType().add("id", "string").add("date", "string").add("value",
"string").add("label", "string").add("detection", "string")
df = spark.readStream.format("kafka") \
    .option("kafka.bootstrap.servers", "localhost:9092") \
    .option("subscribe", "OT") \
    .option("startingOffsets", "earliest") \setminus
    .option("failOnDataLoss", "false") \
    .load()
df = df.selectExpr("CAST(value AS STRING)")
df = df.select(
    expr("CAST(get json object(value, '$.id') AS STRING)").alias("id"),
    expr("CAST(get json object(value, '$.date') AS STRING)").alias("date"),
    expr("CAST(get json object(value, '$.value') AS STRING)").alias("value"),
    expr("CAST(get json object(value, '$.label') AS STRING)").alias("label"),
    expr("CAST(get json object(value, '$.detection') AS
STRING)").alias("detection")
query = df.writeStream \
    .format("csv") \
    .option("path", "output") \
    .option("header", "true") \
    .option("checkpointLocation", "/checkpoints/test2") \
    .start()
query.awaitTermination()
spark.stop()
```

فایل csv تولید شده بصورت زیر است:

```
part-00000-e09a0800-61bd-403f-b3d8-15bb45a59037-c000.csv ×
         id, date, value, label, detection
